

Kissimmee Prairie Preserve State Park

Plant Checklist

*Where the rare
is commonplace.*

This is a living document with many species yet to be verified in the Preserve. Help us improve it by providing verifiable reports (lat/lon and photos preferred) of species not currently on this list to the Preserve biologist or email info@kissimmeeprairiefriends.org.

Kissimmee Prairie Preserve protects the largest remaining tract of the unique Florida dry prairie ecosystem, one of the biologically richest

grasslands in the world. Its 54,000 acres contain a mosaic of dry prairie, wet prairie, marshes, sloughs, cabbage palm and oak hammocks, flood plain—no less than 14 distinct natural communities—which support a vast and diverse array of flora and fauna, including a number of endangered or threatened species. The Preserve has more butterfly diversity than any other Florida state park.
